

6. Migrating a web application to Docker Container

Step 1: Go to <https://killercoda.com/docker/scenario/container-build> and login using google credentials

You will be getting a linux based terminal as shown below:

You may use the below 2 commands only if you face issues while running the docker image;

[To stop and remove the previously built image:

```
docker stop $(docker ps -aq)
```

```
docker rm $(docker ps -aq)
```

After executing these two commands; rebuild the image and run the container]

Step 2: Now Create 2 files ; **app.py** and **Dockerfile**

vi app.py

```
from flask import Flask
```

```
app = Flask(__name__)
```

```
@app.route('/')
```

```
def home():
```

```
    return "Hello Docker from Killercode!"
```

```
if __name__ == '__main__':
```

```
    app.run(host='0.0.0.0', port=8080)
```

```
***
```

vi Dockerfile

```
FROM python:3.10-slim
```

```
WORKDIR /app
```

```
COPY app.py .
```

```
RUN pip install flask
```

```
EXPOSE 8080
```

```
CMD ["python3", "app.py"]
```

Step 3: Build Image

```
docker build -t flask-webapp .
```

Step 4: Run the Container

```
docker run -d -p 8080:8080 flask-webapp
```

Traffic Port Accessor

Access HTTP services which run in your environment

The services need to run on all interfaces (like 0.0.0.0) and not just localhost

Host 1

Common Ports

80

8080

Custom Ports

5000

Access

Click on 8080 and You will get the following message on the browser:

Hello Docker from Killercoda!
